## **EXPERIMENT 8**

**Aim:** Program to count number of 1's and 0's in a given 8 bit number

**LO: 4**

**LO STATEMENT:** Develop the assembly level programming using 8086 loop instruction set

**Software and Hardware Requirements:** TASM Software

### **Theory:**

#### **1. MOV Instruction**

The MOV instruction is the most important command in the 8086 because it moves data from one location to another. It also has the widest variety of parameters; so the assembler programmer can use MOV effectively, the rest of the commands are easier to understand. MOV copies the data in the source to the destination. The data can be either a byte or a word. Sometimes this has to be explicitly stated when the assembler cannot determine from the operands whether a byte or word is being referenced.

#### **Syntax:**

Move Destination, Source

#### **Example:**

MOV Ax, Bx

#### **2. SHR Instruction**

SHR shifts the bits within the destination operand to the right, where right is toward the least-significant bit (LSB). The number of bit positions shifted may be specified either as an 8-bit immediate value, or by the value in CL—not CX or ECX. (The 8086 and 8088 are limited to the immediate value 1.) Note that while CL may accept a value up to 255, it is meaningless to shift by any value larger than 16—or 32 in 32-bit mode—even though the shifts are actually performed on the 8086 and 8088. (The 286 and later limit the number of shift operations performed to the native word size except when running in Virtual 86 mode.) The rightmost bit of the operand is shifted into the Carry flag; the leftmost bit is cleared to 0. The Auxiliary carry flag (AF) becomes undefined after this instruction. OF is modified *only* by the shift-by-one forms of SHL; after shift-by-CL forms, OF becomes undefined.

#### **Syntax:**

SHR Register, Bits to be shifted

#### **Example:**

SHR AX, 2

### **3. INT instruction:**

Interrupt is the method of creating a temporary halt during program execution and allows peripheral devices to access the microprocessor. The microprocessor responds to that interrupt with an ISR (Interrupt Service Routine), which is a short program to instruct the microprocessor on how to handle the interrupt.

#### **Example:**

INT 21H

### **4. JC Instruction:**

JC stands for 'Jump if Carry' . It checks whether the carry flag is set or not. If yes, then jump takes place, that is: If  $CF = 1$ , then jump.

#### **Example:**

JC me

### **5. JMP Instruction:**

Conditional execution often involves a transfer of control to the address of an instruction that does not follow the currently executing instruction. Transfer of control may be forward, to execute a new set of instructions or backward, to re-execute the same steps. The JMP instruction provides a label name where the flow of control is transferred immediately.

#### **Syntax:**

JMP label

#### **Example:**

JMP next

### **6. INC Instruction:**

The INC instruction adds one to the destination operand, while preserving the state of the carry flag CF. The destination operand can be a register or a memory location. This instruction allows a *loop counter* to be updated without disturbing the CF flag.

**Syntax:** INC destination

## **Code:**

assume ds:data,cs:code

data segment

no db 57H

c0 db 01 dup(?)

c1 db 01 dup(?)

data ends

code segment

start:mov Ax,data

    mov Ds,Ax

    mov cx,08H

    mov Ah,no

up:  SHR Ah,1

    JC down

    INC c0

    JMP next

down: INC c1

    JMP next

next: LOOP up

    mov AH,4CH

    INT 21H

code ends

end start

The screenshot shows a debugger window for a CPU 80486. The main window displays assembly code with addresses, hex values, and mnemonics. To the right, a register window shows the current state of various registers. At the bottom, a memory window displays hex data.

Address	Hex	Mnemonic	Comment
48AE:000C	D0EC	shr	ah,1
48AE:000E	7207	jb	0017
48AE:0010	FE060100	inc	byte ptr [000]
48AE:0014	EB08	jmp	001E
48AE:0016	90	nop	
48AE:0017	FE060200	inc	byte ptr [000]
48AE:001B	EB01	jmp	001E
48AE:001D	90	nop	
48AE:001E	E2EC	loop	000C
48AE:0020	B44C	mov	ah,4C
48AE:0022	CD21	int	21
48AE:0024	0000	add	[bx+si],al
48AE:0026	0000	add	[bx+si],al

  

Register	Value
ax	0192
bx	0018
cx	0012
dx	09E3
si	10AB
di	3256
bp	0100
sp	0106
ds	2110
es	114E
ss	0192
cs	0000
ip	0000

  

Address	Hex
48AD:0000	57 03 05 00 00 00 00 00
48AD:0008	00 00 00 00 00 00 00 00
48AD:0010	B8 AD 48 8E D8 B9 08 00
48AD:0018	8A 26 00 00 D0 EC 72 07

## Conclusion:

From this experiment we have learned how to use different types of commands and to count the number of 0 and 1 in a binary number.
